

Monitor & Talkback Controller MTC 2381

With the MTC 2381 Monitor & Talkback controller SPL has expanded its monitor controller series for DAW users. As with the Surround Monitor Controller SMC 2380, an especially robust, ergonomic case and construction predestines the MTC for the desktop—for example, near or under computer screens.

MTC 2381 volume level control and loudspeaker management combines stereo monitoring with comfortable talkback and cue functions. A fully discrete design dispenses with VCAs, DACs etc. and provides direct analog signal paths, guaranteeing a loss-free signal processing for high resolution audio formats like SACD or DVD-A.

There are six rear-panel stereo inputs for four balanced and two unbalanced sources as well as balanced XLR outputs for three loudspeaker pairs. The input signal can be routed over a direct slave-output.

Monitoring and switching functions include sources and loudspeakers, mono, dim, muting and a head-phone output. Individual volume control pencil marking is possible.

The talkback section has a built in microphone, separate output and a foot switch input. The cue-mix also has a separate output and provides musician level, mix level and volume controls.
